

SELF TINTING RESIDENTIAL SKYLIGHTS

The sun alone provides enough energy for window to tint. SolarSmart continuously adapts to the environment and automatically darkens & lightens throughout the day & season to maximize solar heat gain & provide user comfort. When exposed to the sun, SolarSmart Glass will self-tint & automatically darken.

Vertical windows receive various amounts of this power depending on changes of the sun angle during the day, month and year. Unlike many other systems, SolarSmart windows functions by themselves, without manual, electronic or mechanical controls. This minimizes the inconvenience for the homeowner and maximizes the potential energy savings, since no action is required to activate the windows.
